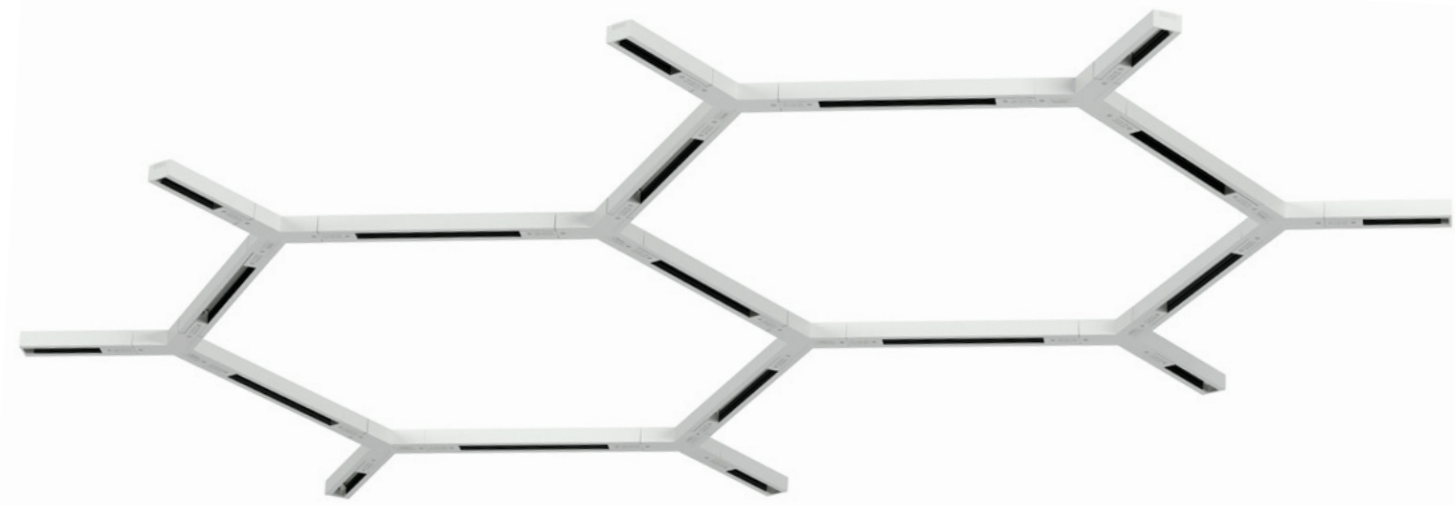
1-circuit track

Great performance in smallest space



Next step in the evolution of lighting tracks: The design of the new 1-circuit track with integrated data bus and flush-mounted adapter has now become even more compact. For the first time, track systems in honeycomb structures are now possible: the new Y-connectors break up the current linear installations and make an even wider variety of design ideas feasible. Thanks to the use of efficient LED spotlights and innovative control system, 1-circuit tracks systems are future-orientated and a 3-circuit track system can be waived. The modern and puristic design is as appealing as subtle; the reduced use of materials allows an attractive pricing.

Main specifications of 1-circuit track

- More compact than the classic 3-circuit track system
- Adapter flush mounted on the track
- Fixture heads can be rotated real 360° on the adapter
- Wide range of system components available
- Y-connector can be used to build honeycomb structures
